[E-LOCKERS

VALUABLE ITEMS

If you wish to store valuable items with limited access and full traceability, choose E-Lockers Inc.

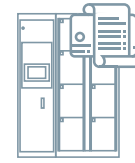

Our E-Locker systems are routinely used for storing items such as: Valuable Equipment, Surveillance Equipment, Evidence Storage, Legal Files, and Weapon Storage.

Easily customize the E-Lockersinc 2.0 Software to suit your application.

Select your colour scheme and upload logos.

Administrator enrolls users with exclusive access to lockers.

Select single or double authentication using RFID access cards, barcode scanning of ID badges, or 6 digit PINs.

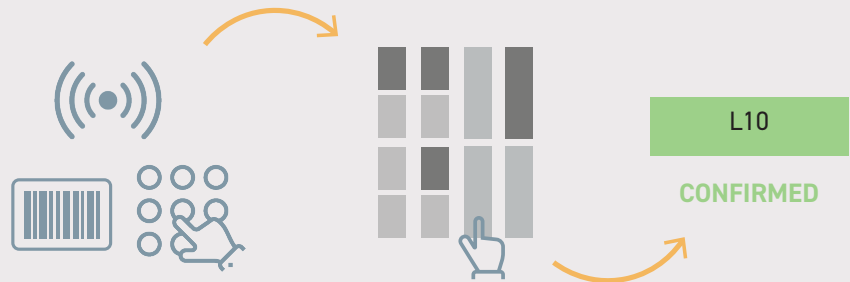

Lockers can be configured for temporary or permanent use.

User Flow for Private Lockers

The user taps the touchscreen computer on the kiosk and is prompted to select between storing or retrieving their item(s).

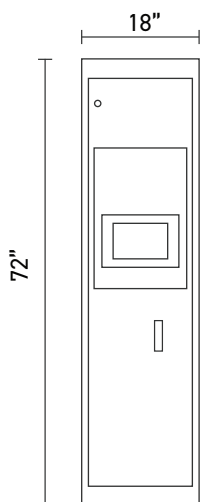

To store items, the user is then asked to provide authentication through either an RFID tap, barcode scan, and/or PIN entry. The user then selects a locker that will open for access. User closes the locker after storing their item(s). An audio alert will sound if the locker has been left open. At the kiosk, the user is now able to open locker where they stored their belongings or to select an available locker. To retrieve items, the user simply selects "Access Locker", selects their locker, and enters their authentication.

E-Lockersinc provides the ultimate traceability to keep your valuables secure.

A mid-sized security office of 30 employees based in British Columbia, Canada regularly signed-out expensive equipment such as night vision goggles, and struggled to keep track of these items. Our secure lockers with assigned user profiles provide the traceability needed to locate missing equipment based on who accessed the locker and when, as well as monitoring the frequency items are being checked out.

The solution was a 12-door locker with a kiosk. Each locker compartment contains a specific piece of equipment that registered employees can access with their RFID ID card attached to their user profile. Equipment availability is shown on the kiosk after an employee scans their ID. At the end of each month, the admin reporting function shows the office manager who has accessed each locker, and when. The amount of missing equipment is now virtually non-existent, as only designated employees can access the lockers, and the office manager is able to track down the employee who last accessed the each piece of equipment.
